

Отчет

Лабораторная работа 2.1. Изучение методов хранения данных на основе NoSQL

Цель работы: освоить принципы хранения и обработки данных в различных типах NoSQL систем — документо-ориентированных (MongoDB), графовых (Neo4j) и ключ-значение (Redis). В ходе выполнения работы необходимо научиться создавать и наполнять базы данных, выполнять запросы и анализировать результаты, что позволит закрепить навыки работы с нереляционными моделями данных и понять их особенности.

Описание процесса выполнения

Установка

Установила докер и проверила успешность его установки через терминал

Клонировала данный в задании репозиторий

```

Подключение на питоне

Работа с MongoDB через pymongo

Скопировала и выполнила код, данный в задании, в ячейке Jupyter. Он демонстрирует полный цикл CRUD-операций: подключение, создание данных, чтение, обновление и удаление.

The screenshot shows a Jupyter Notebook interface with a single code cell containing Python code for MongoDB operations. The code performs the following steps:

- Establishes a connection to MongoDB using the URI `mongo_uri = "mongodb://root:abc123@localhost:27017/"`.
- Creates a collection named `student` in the database `test_labs`.
- Pings the MongoDB server to verify the connection.
- Selects the `student` collection.
- Deletes all documents in the collection.
- Inserts three test documents representing lab results.
- Prints the number of inserted documents.
- Reads all documents from the collection.
- Updates a document in the collection.
- Prints the updated document.
- Deletes a document from the collection.
- Prints the count of remaining documents.

The output of the code execution is visible at the bottom of the cell, showing the results of each operation.

This screenshot shows the continuation of the Jupyter Notebook session. The code now includes exception handling and cleanup steps:

- Prints the current contents of the collection.
- Iterates through the collection to print each document.
- Updates a document in the collection.
- Prints the updated document.
- Deletes a document from the collection.
- Prints the count of remaining documents.
- Attempts to drop the collection, catching a `Exception` if it fails.
- Prints a message if the drop operation fails.
- Closes the MongoDB client connection.
- Prints a message confirming the connection is closed.

The output shows the successful execution of the code, including the printed documents and the final state of the collection.

Работа с Redis через redis-py

Следующий код демонстрирует работу с основными типами данных в Redis. Выполнила его в новой ячейке Jupyter.

```
File Edit View Run Kernel Tabs Settings Help
ЛБ_1.ipynb + 
[2]: import redis

try:
    # 1. Подключение к Redis (корректные параметры для VM)
    r = redis.Redis(host='localhost', port=6379, db=0, decode_responses=True)
    r.ping()
    print("Соединение с Redis успешно установлено.")

    # 2. Работа со строками (String)
    r.set('user1:name', 'Alice')
    user_name = r.get('user1:name')
    print(f"\nСтрока: user1:name = {user_name}")

    # 3. Работа с хешами (Hash) – для хранения объектов
    r.hset('user2', mapping={'name': 'Bob', 'email': 'bob@example.com'})
    user_info = r.hgetall('user2')
    print(f"\nХеш: user2 = {user_info}")

    # 4. Работа со списками (List) – для очередей, логов
    r.lpush('tasks', 'task1', 'task2', 'task3')
    tasks = r.lrange('tasks', 0, -1)
    print(f"\nСписок: tasks = {tasks}")

    # 5. Работа с множествами (Set) – для уникальных элементов
    r.sadd('online_users', 'user_a', 'user_b', 'user_c', 'user_a')
    online_count = r.scard('online_users')
    print(f"\nМножество: {r.members('online_users')}, количество онлайн: {online_count}")

    # 6. Очистка созданных ключей
    keys_to_delete = ['user1:name', 'user2', 'tasks', 'online_users']
    r.delete(*keys_to_delete)
    print("\nТестовые ключи удалены.")

except redis.ConnectionError as e:
    print(f"\nОшибка подключения к Redis: {e}")

Соединение с Redis успешно установлено.

Строка: user1:name = Alice
Хеш: user2 = {'name': 'Bob', 'email': 'bob@example.com'}
Список: tasks = ['task3', 'task2', 'task1']
Множество: {'user_c', 'user_b', 'user_a'}, количество онлайн: 3
```

Работа с Neo4j через neo4j-driver

Данный код показывает, как выполнить Cypher-запрос к базе данных Neo4j и обработать результаты.

The screenshot shows a Jupyter Notebook interface with a single tab titled 'ЛБ_1.ipynb'. The code cell contains Python code for connecting to a Neo4j database and executing a Cypher query to retrieve movie titles. A red box highlights the output area, which displays several warning messages from the Neo4j server about missing labels ('Movie') in the query. The code uses the py2neo library to interact with the database.

```
# 1. Задайте параметры подключения (корректные для VM)
uri = "bolt://localhost:7687"
user = "neo4j"
password = "abc123abc123" # <<< МИНИМАЛЬНОЕ изменение: твой пароль из docker inspect

def get_movies(tx, movie_limit):
    # 2. Cypher-запрос для получения названий фильмов
    query = """
    MATCH (m:Movie)
    RETURN m.title AS title
    LIMIT $limit
    """
    result = tx.run(query, limit=movie_limit)

    # 3. Извлечение данных из результата
    return [record["title"] for record in result]

try:
    # 4. Создание сессии и выполнение транзакции
    with GraphDatabase.driver(uri, auth=(user, password)) as driver:
        with driver.session() as session:
            movies = session.read_transaction(get_movies, 5) # Получаем 5 фильмов
            print("Подключение к Neo4j успешно.")
            print("5 фильмов из базы данных:")
            for movie in movies:
                print(f"- {movie}")

except Exception as e:
    print(f"Ошибка при работе с Neo4j: {e}")

/var/folders/wf/q9h5vr9x74g6d9d5q68_1m4m0000gn/T/ipykernel_93477/2640146855.py:24: DeprecationWarning: read_transaction has been renamed to execute_read
movies = session.read_transaction(get_movies, 5) # Получаем 5 фильмов
Received notification from DBMS server: {severity: WARNING} {code: Neo.ClientNotification.Statement.UnknownLabelWarning} {category: UNRECOGNIZED} {title: The provided label is not in the database.} {description: One of the labels in your query is not available in the database, make sure you didn't misspell it or that the label is available when you run this statement in your application (the missing label name is: Movie)} {position: line: 2, column: 10, offset: 14} for query: '\n    MATCH (m:Movie)\n    RETURN m.title AS title\n    LIMIT $limit'
Received notification from DBMS server: {severity: WARNING} {code: Neo.ClientNotification.Statement.UnknownPropertyKeyWarning} {category: UNRECOGNIZED} {title: The provided property key is not in the database.} {description: One of the property names in your query is not available in the database, make sure you didn't misspell it or that the label is available when you run this statement in your application (the missing property name is: title)} {position: line: 3, column: 18, offset: 34} for query: '\n    MATCH (m:Movie)\n    RETURN m.title AS title\n    LIMIT $limit'
Подключение к Neo4j успешно.
5 фильмов из базы данных:
```

В результате код выдал предупреждение о том, что в базе Neo4j нет узлов с меткой Movie. Код выполняется, но возвращать нечего, поэтому список фильмов пустой.

Jackson) and Vincent Vega (John Travolta) are two men who have been hired by Mr. Pink (Ugo Tognazzi) to escort a bag of \$100 million dollars from a bank vault to a safe house. They are also to kill Mr. White (Bruce Campbell), the man who gave them the job. The job goes wrong when they are ambushed by Mr. White's hitmen, and the two men must fight their way through the city to get back to the safe house. Along the way, they meet a woman named Mia Wallace (Uma Thurman) and her friend, the hitman Butch Coolidge (Mike Myers). The two men also encounter a group of police officers who are trying to stop them. The movie is a mix of action, comedy, and drama, with some dark and violent scenes. It is directed by Quentin Tarantino and written by him and Robert Rodriguez. The film was a critical and commercial success, winning several awards and becoming a cult classic."</code> <code>coverUrl: "https://m.media-amazon.com/images/M/MVSBNzQzOTk3OTAtNDQzI00ZTVkLWj0MTLwFjM2_"</code> <code>actors: Array (12)</code> <code>directors: Array (1)</code> <code>producers: Array (7)</code>

This screenshot shows the Compass MongoDB interface with the 'persons' collection selected. The 'Documents' tab shows 0 documents. An 'ADD DATA' button is visible. A modal window titled 'Insert Document' is open, showing a JSON document being inserted into the 'filldb.persons' collection. The document contains fields like 'id', 'name', 'headshot', 'birthDate', 'tradeMarks', and 'actedInMovies'. The 'actedInMovies' field is an array of movie IDs. At the bottom of the modal are 'Cancel' and 'Insert' buttons.

filmdb> 

```

Проверка:

Чтобы получить все Family фильмы, выполнила:

```
[filmdb> db.movies.find({"genres": "Family"})
[
  {
    _id: ObjectId('68bfcf05154255260cfa3366'),
    id: '0038650',
    title: "It's a Wonderful Life",
    genres: [ 'Drama', 'Family', 'Fantasy' ],
    year: 1946,
    rating: 8.6,
    rank: 25
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3368'),
    id: '0245429',
    title: 'Spirited Away',
    genres: [ 'Animation', 'Adventure', 'Family', 'Fantasy', 'Mystery' ],
    year: 2001,
    rating: 8.5,
    rank: 27
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3374'),
    id: '0027977',
    title: 'Modern Times',
    genres: [ 'Comedy', 'Drama', 'Family', 'Romance' ],
    year: 1936,
    rating: 8.5,
    rank: 39
  },
  {
    _id: ObjectId('68bfcf05154255260cfa337a'),
    id: '0110357',
    title: 'The Lion King',
    genres: [ 'Animation', 'Adventure', 'Drama', 'Family', 'Musical' ],
    year: 1994,
    rating: 8.5,
    rank: 45
  }
]
filmdb> █
```

Чтобы хотим получить все фильмы, которые были опубликованы в 2010 году и позже, мы можем сделала следующее:

```
[filmdb> db.movies.find({ "genres": "Action", "year": { $gte : 2010 } })
[
  {
    _id: ObjectId('68bfcf05154255260cfa3359'),
    id: '4154796',
    title: 'Avengers: Endgame',
    genres: [ 'Action', 'Adventure', 'Fantasy', 'Sci-Fi' ],
    year: 2019,
    rating: 8.8,
    rank: 11
  },
  {
    _id: ObjectId('68bfcf05154255260cfa335d'),
    id: '1375666',
    title: 'Inception',
    genres: [ 'Action', 'Adventure', 'Sci-Fi', 'Thriller' ],
    year: 2010,
    rating: 8.7,
    rank: 15
  }
]
filmdb>
```

Чтобы найти все фильмы, которые не относятся к жанру Drama

```
[filmdb> db.movies.find({ $ne: "Drama" })

  }
]

```

Мы видим, что только два фильма имеют установленное свойство `plotOutline`.

Оператор `$in` можно использовать для сопоставления одного из нескольких значений, которые мы передаем как массив.

```
[filmdb> db.movies.find({ "genres": { $in: ['Family', 'Mystery'] } })
[
  {
    _id: ObjectId('68bfcf05154255260cfa3366'),
    id: '0038650',
    title: "It's a Wonderful Life",
    genres: [ 'Drama', 'Family', 'Fantasy' ],
    year: 1946,
    rating: 8.6,
    rank: 25
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3368'),
    id: '0245429',
    title: 'Spirited Away',
    genres: [ 'Animation', 'Adventure', 'Family', 'Fantasy', 'Mystery' ],
    year: 2001,
    rating: 8.5,
    rank: 27
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3374'),
    id: '0027977',
    title: 'Modern Times',
    genres: [ 'Comedy', 'Drama', 'Family', 'Romance' ],
    year: 1936,
    rating: 8.5,
    rank: 39
  },
  {
    _id: ObjectId('68bfcf05154255260cfa337a'),
    id: '0110357',
    title: 'The Lion King',
    genres: [ 'Animation', 'Adventure', 'Drama', 'Family', 'Musical' ],
    year: 1994,
    rating: 8.5,
    rank: 45
  }
]
```

filmdb> █

который возвращает все фильмы в жанре Family или Mystery.

Чтобы найти все фильмы жанра Music OR которые были выпущены в 2012 году или позже

```
[filmdb> db.movies.find({ $or: [ { "genres":"Music" }, { "year": { $gte : 2012 } } ] })
[
  {
    _id: ObjectId('68bfcf05154255260cfa3359'),
    id: '4154796',
    title: 'Avengers: Endgame',
    genres: [ 'Action', 'Adventure', 'Fantasy', 'Sci-Fi' ],
    year: 2019,
    rating: 8.8,
    rank: 11
  },
  {
    _id: ObjectId('68bfcf05154255260cfa336d'),
    id: '0816692',
    title: 'Interstellar',
    genres: [ 'Adventure', 'Drama', 'Sci-Fi' ],
    year: 2014,
    rating: 8.5,
    rank: 32
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3373'),
    id: '0253474',
    title: 'The Pianist',
    genres: [ 'Biography', 'Drama', 'Music', 'War' ],
    year: 2002,
    rating: 8.5,
    rank: 38
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3379'),
    id: '2582802',
    title: 'Whiplash',
    genres: [ 'Drama', 'Music' ],
    year: 2014,
    rating: 8.5,
    rank: 44
  }
]
filmdb> █
```

Чтобы найти все фильмы жанра Action AND, которые были выпущены в 2010 году или позже OR имеют рейтинг выше 8.8

```
[filmdb> db.movies.find({ "genres":"Action", $or: [ { "year": { $gte : 2010 } }, { "rating": { $gt : 8.8 } } ] })
[
  {
    _id: ObjectId('68bfcf05154255260cfa3353'),
    id: '0468569',
    title: 'The Dark Knight',
    genres: [ 'Action', 'Crime', 'Drama', 'Thriller' ],
    year: 2008,
    rating: 9,
    rank: 4
  },
  {
    _id: ObjectId('68bfcf05154255260cfa3359'),
    id: '4154796',
    title: 'Avengers: Endgame',
    genres: [ 'Action', 'Adventure', 'Fantasy', 'Sci-Fi' ],
    year: 2019,
    rating: 8.8,
    rank: 11
  },
  {
    _id: ObjectId('68bfcf05154255260cfa335d'),
    id: '1375666',
    title: 'Inception',
    genres: [ 'Action', 'Adventure', 'Sci-Fi', 'Thriller' ],
    year: 2010,
    rating: 8.7,
    rank: 15
  }
]
filmdb> █
```

ObjectId, который MongoDB сгенерировал для нашего поля `_id`, можно выбрать следующим образом:

```
filmdb> db.movies.find({_id: ObjectId("68bfce26315fd46642fa3350")})
...
█
```

Обновление документов

В своей простейшей форме `updateOne()` принимает два параметра: селектор (`where`) для использования и обновления, которые нужно применить к полям. Допустим, мы хотим изменить рейтинг фильма *Fight Club* на 9

```
[filmdb> db.movies.updateOne ( {title: 'Fight Club'} , { $set: {rating: 9} } )
{
  acknowledged: true,
  insertedId: null,
  matchedCount: 1,
  modifiedCount: 1,
  upsertedCount: 0
}
filmdb> █
```

Если мы хотим увеличить количество голосов для фильма "The Matrix", которое в настоящее время установлено на 1496538, как мы можем легко увидеть с помощью `find`

```
[filmdb> db.movies.find( {title: 'The Matrix'}, {"votes":1})
[ { _id: ObjectId('68bfc9d16690dd5e150425da'), votes: 1496538 } ]
[filmdb> db.movies.updateOne( {title: 'The Matrix'} , { $inc: {votes: 1} } )
{
  acknowledged: true,
  insertedId: null,
  matchedCount: 1,
  modifiedCount: 1,
  upsertedCount: 0
}
filmdb> █
```

В данном случае результат говорит нам, что операция успешно обновила один документ с названием "The Matrix", увеличив значение его поля votes на 1.

проверить новый результат, используя тот же find второй раз

```
[filmdb> db.movies.find( {title: 'The Matrix'}, {"votes":1})
[ { _id: ObjectId('68bfc9d16690dd5e150425da'), votes: 1496539 } ]
filmdb> █
```

Оптимизация производительности с помощью индексов

Давайте добавим индекс по названию фильмов. Для возрастающего индекса по полю укажите значение 1; для убывающего индекса укажите значение -1.

если мы теперь выполним запрос по названию, будет использован индекс

```
[filmdb> db.movies.createIndex( {title: 1} );
title_1
filmdb> db.movies.find({ title: "The Matrix" }).explain();
[...
{
  explainVersion: '1',
  queryPlanner: {
    namespace: 'filmdb.movies',
    indexFilterSet: false,
    parsedQuery: { title: { '$eq': 'The Matrix' } },
    queryHash: '553F28EB',
    planCacheKey: 'DA190D56',
    optimizationTimeMillis: 10,
    maxIndexedOrSolutionsReached: false,
    maxIndexedAndSolutionsReached: false,
    maxScansToExplodeReached: false,
    winningPlan: {
      stage: 'FETCH',
      inputStage: {
        stage: 'IXSCAN',
        keyPattern: { title: 1 },
        indexName: 'title_1',
        isMultiKey: false,
        multiKeyPaths: { title: [] },
        isUnique: false,
        isSparse: false,
        isPartial: false,
        indexVersion: 2,
        direction: 'forward',
        indexBounds: { title: [ '["The Matrix", "The Matrix"]' ] }
      }
    },
    rejectedPlans: []
  },
  command: { find: 'movies', filter: { title: 'The Matrix' }, '$db': 'filmdb' },
  serverInfo: {
    host: 'mongo-1',
    port: 27017,
    version: '7.0.23',
    gitVersion: '78d6d71385be23831b5971993af60bcafed785bc'
  },
  serverParameters: {
    internalQueryFacetBufferSizeBytes: 104857600,
    internalQueryFacetMaxOutputDocSizeBytes: 104857600,
    internalLookupStageIntermediateDocumentMaxSizeBytes: 104857600,
    internalDocumentSourceGroupMaxMemoryBytes: 104857600,
    internalQueryMaxBlockingSortMemoryUsageBytes: 104857600,
    internalQueryProhibitBlockingMergeOnMongoS: 0,
    internalQueryMaxAddToSetBytes: 104857600,
    internalDocumentSourceSetWindowFieldsMaxMemoryBytes: 104857600,
    internalQueryFrameworkControl: 'forceClassicEngine'
  },
  ok: 1
}
filmdb> █
```

Давайте добавим индекс по полю id, чтобы убедиться, что оно уникально.

```
[filmdb> db.movies.createIndex( {id: 1}, {unique: true} );
id_1
filmdb> █
```

Если мы теперь попытаемся добавить один из фильмов второй раз, мы получим ошибку:

```
[filmdb> db.movies.insertOne( {"id": "0111161", "title": "The Shawshank Redemption", "genres": ["Drama"], "year": 1994, "rating": 9.2, "rank": 1}
MongoServerError: E11000 duplicate key error collection: filmdb.movies index: id_1 dup key: { id: "0111161" }
filmdb> █
```

Мы можем просмотреть индексы, которые у нас есть в настоящее время в коллекции movies, используя db.movies.getIndexes():

```
[filmdb> db.movies.getIndexes()
[
  { v: 2, key: { _id: 1 }, name: '_id_' },
  { v: 2, key: { title: 1 }, name: 'title_1' },
  { v: 2, key: { id: 1 }, name: 'id_1', unique: true }
]
filmdb> █
```

Индекс может быть удален с помощью команды dropIndex.

```
[filmdb> db.movies.dropIndex( {title: 1} );
{ nIndexesWas: 3, ok: 1 }
filmdb> █
```

Текстовый поиск

Например, вы можете выполнить следующее в оболочке mongo, чтобы разрешить текстовый поиск по полям title и plotOutline:

```
[filmdb> db.movies.createIndex ( { title: "text", plotOutline: "text" } )
title_text_plotOutline_text
```

Теперь давайте выполним текстовый поиск по термину "fight"

```

[filmdb> db.movies.find( { $text: { $search: "fight" } } )
[
  {
    _id: ObjectId('68bfcf05154255260cfca3358'),

      { producerID: '0918424', name: 'Bob Weinstein' },
      { producerID: '0000544', name: 'Harvey Weinstein' }
    ]
  }
]
filmdb>

```

Агрегация данных

мы хотим увидеть, сколько фильмов у нас есть для разных рейтингов

```

[filmdb> db.movies.aggregate( [{$group:{_id:'$rating', total: { $sum:1 }}}])
[
  { _id: 8.6, total: 7 },
  { _id: 8.9, total: 4 },
  { _id: 8.4, total: 1 },
  { _id: 8.8, total: 3 },
  { _id: 8.5, total: 23 },
  { _id: 8.7, total: 7 },
  { _id: 9, total: 3 },
  { _id: 9.2, total: 2 }
]
filmdb>

```

В следующем примере мы группируем по genres и подсчитываем количество фильмов для каждого жанра. Поскольку поле genres является массивом, сначала мы должны использовать \$unwind для разворачивания массива. Мы также возвращаем минимальный, максимальный и средний рейтинг для каждой группы. Результат сортируется по количеству фильмов в жанре в порядке убывания.

```

filmdb> db.movies.aggregate([
...   { $match: { $max: { $gt: 2000 } } },
...   { $sumwind: "Genres" },
...   { $group: { _id: "$Genres",
...     number: { $sum: 1 },
...     minRating: { $min: "$rating" },
...     maxRating: { $max: "$rating" },
...     avgRating: { $avg: "$rating" }
...   },
...   { $sort: { number: -1 } } ]
[{"_id": "Drama", "number": 13, "minRating": 8.5, "maxRating": 9, "avgRating": 8.636363636363637}, {"_id": "Adventure", "number": 7, "minRating": 8.5, "maxRating": 8.9, "avgRating": 8.7}, {"_id": "Fantasy", "number": 5, "minRating": 8.5, "maxRating": 8.9, "avgRating": 8.74}, {"_id": "Sci-Fi", "number": 4, "minRating": 8.5, "maxRating": 8.8, "avgRating": 8.625}, {"_id": "Thriller", "number": 4, "minRating": 8.5, "maxRating": 9, "avgRating": 8.675}, {"_id": "Crime", "number": 3, "minRating": 8.5, "maxRating": 9, "avgRating": 8.700000000000001}, {"_id": "Action", "number": 3, "minRating": 8.5, "maxRating": 9, "avgRating": 8.833333333333334}, {"_id": "Mystery", "number": 2, "minRating": 8.5, "maxRating": 9, "avgRating": 8.75}
]

```

Удаление документов

Если мы хотим удалить конкретный документ, например фильм "Fight Club", мы можем выполнить

```
[filmdb> db.movies.deleteOne( { "title": "Fight Club" } )
{ acknowledged: true, deletedCount: 1 }
filmdb> ]
```

Мы видим, что, как и ожидалось, один фильм был удален.

ИНДИВИДУАЛЬНОЕ ЗАДАНИЕ 1

Задание 1 (MongoDB)

вариант 17

Найти все фильмы, у которых в массиве genres ровно 2 элемента (\$size).

Через терминал:

```

filmdb> db.movies.find({ genres: { $size: 2 } })
[...]
{
  _id: ObjectId('68bfc7d86690dd5e150425d5'),
  id: '0110912',
  title: 'Pulp Fiction',

Начало работы с Redis

Использование утилиты командной строки Redis

Открыла еще одно окно терминала и ввела следующую команду, чтобы запустить Redis CLI в другом docker-контейнере:

```

(base) sofia@MacBook-Air-2 ~ % docker run -it --rm --network nosql-platform bitnami/redis redis-cli -h redis-1 -p 6379
Unable to find image 'bitnami/redis:latest' locally
latest: Pulling from bitnami/redis
fd8e129b0dd03: Pull complete
Digest: sha256:25bf63f3caf75af4628c0dfcf398859ad1ac8abe135be85e99699f9637b16dc28
Status: Downloaded newer image for bitnami/redis:latest
redis> 10:15:49.53 INFO >>> Welcome to the Bitnami redis container
redis> 10:15:49.53 INFO ==> Subscribe to project updates by watching https://github.com/bitnami/containers
redis> 10:15:49.53 INFO ==> NOTICE: Starting August 28th, 2025, only a limited subset of images/charts will remain available for free. Backup will be available for some time at the 'Bitnami Legacy' repository. More info at https://github.com/bitnami/containers/issues/83267
redis> 10:15:49.54 INFO ==>

```

Для проверки соединения ввела простую команду PING

Ввела help, чтобы увидеть версию установленного Redis.

```

[redis-1:6379> PING
PONG
[redis-1:6379> help
redis-cli 8.2.1
To get help about Redis commands type:
    "help @<group>" to get a list of commands in <group>
    "help <command>" for help on <command>
    "help <tab>" to get a list of possible help topics
    "quit" to exit

To set redis-cli preferences:
    ":set hints" enable online hints
    ":set nohints" disable online hints
Set your preferences in ~/.redisclirc
redis-1:6379> █

```

Структура данных "Строка" (String)

```

[redis-1:6379> help @string
  APPEND key value
  summary: Appends a string to the value of a key. Creates the key if it doesn't exist.
  since: 2.0.0

  DECR key
  summary: Decrements the integer value of a key by one. Uses 0 as initial value if the key doesn't exist.
  since: 1.0.0

  DECRBY key decrement
  summary: Decrements a number from the integer value of a key. Uses 0 as initial value if the key doesn't exist.
  since: 1.0.0

  GET key
  summary: Returns the string value of a key.
  since: 1.0.0

  GETDEL key
  summary: Returns the string value of a key after deleting the key.
  since: 6.2.0

  GETEX key [EX seconds|PX milliseconds|EXAT unix-time-seconds|PXAT unix-time-milliseconds|PERSIST]
  summary: Returns the string value of a key after setting its expiration time.
  since: 6.2.0

  GETRANGE key start end
  summary: Returns a substring of the string stored at a key.
  since: 2.4.0

  GETSET key value
  summary: Returns the previous string value of a key after setting it to a new value.
  since: 1.0.0

  INCR key
  summary: Increments the integer value of a key by one. Uses 0 as initial value if the key doesn't exist.
  since: 1.0.0

  INCRBY key increment
  summary: Increments the integer value of a key by a number. Uses 0 as initial value if the key doesn't exist.
  since: 1.0.0

  INCRBYFLOAT key increment
  summary: Increment the floating point value of a key by a number. Uses 0 as initial value if the key doesn't exist.
  since: 2.6.0

  LCS key1 key2 [LEN] [IDX] [MINMATCHLEN min-match-len] [WITHMATCHLEN]
  summary: Finds the longest common substring.
  since: 7.0.0

  MGET key [key ...]
  summary: Atomically returns the string values of one or more keys.
  since: 1.0.0

  MSET key value [key value ...]
  summary: Atomically creates or modifies the string values of one or more keys.
  since: 1.0.1

  MSETNX key value [key value ...]
  summary: Atomically modifies the string values of one or more keys only when all keys don't exist.
  since: 1.0.1

  PSETEX key milliseconds value

```

Работа с ключами

Можно использовать команду SET для сохранения значения “redis-server” по ключу “server:name”

Redis сохранит данные на постоянной основе, поэтому позже можем спросить: «Какое значение хранится по ключу server:name?»

и Redis ответит “redis-server”.

```
[redis-1:6379] > SET server:name "redis-server"
[redis-1:6379] > OK
[redis-1:6379] > GET server:name
[redis-1:6379] > "redis-server"
[redis-1:6379] > EXISTS server:name
[redis-1:6379] > (integer) 1
[redis-1:6379] > KEYS server*
[redis-1:6379] > 1) "server:name"
[redis-1:6379] > KEYS *
[redis-1:6379] > 1) "server:name"
[redis-1:6379] > 2) "task_queue"
[redis-1:6379] >
```

Операции Get и Set

Сначала установим значение для ключа connections с помощью команды SET

Проверим значение с помощью команды GET

Попробуем перезаписать его с помощью другой команды SET

Посмотрим, что произойдет, если использовать команду SETNX

Если используем SETNX для ключа, который еще не существует, получим другой ответ

Используем MSET для установки нескольких пар «ключ-значение» и обратную команду MGET, чтобы получить несколько значений для нескольких ключей.

```
[redis-1:6379> SET connections 10
OK
[redis-1:6379> GET connections
"10"
[redis-1:6379> SET connections 20
OK
[redis-1:6379> GET connections
"20"
[redis-1:6379> SETNX connections 30
(integer) 0
[redis-1:6379> GET connections
"20"
[redis-1:6379> SETNX newkey 30
(integer) 1
[redis-1:6379> MSET key1 10 key2 20 key3 30
OK
[redis-1:6379> MGET key1 key3
1) "10"
2) "30"
redis-1:6379> █
```

Операции инкремента и декремента

Инициализируем значение connections равным 10, а затем используем INCR, чтобы увеличить его на единицу.

Видим, что в ответ получаем новое значение счетчика.

Увеличим его на 10, используя команду INCRBY.

Выполним обратную операцию: уменьшим значение счетчика. С помощью команды DECR счетчик уменьшается на единицу.

А затем с помощью DECRBY укажем величину, на которую уменьшим значение ключа (используем 10).

Удалим пару «ключ-значение» и посмотрим, что произойдет, если используем INCR для несуществующего ключа.

Мы видим, что INCR автоматически начинает со значения 0 и увеличивает его на 1, что и является результатом, который получили.

```
[redis-1:6379] > SET connections 10
[redis-1:6379] > OK
[redis-1:6379] > INCR connections
[redis-1:6379] > (integer) 11
[redis-1:6379] > INCRBY connections 10
[redis-1:6379] > (integer) 21
[redis-1:6379] > DECR connections
[redis-1:6379] > (integer) 20
[redis-1:6379] > DECRBY connections 10
[redis-1:6379] > (integer) 10
[redis-1:6379] > DEL connections
[redis-1:6379] > (integer) 1
[redis-1:6379] > EXISTS connections
[redis-1:6379] > (integer) 0
[redis-1:6379] > INCR connections
[redis-1:6379] > (integer) 1
[redis-1:6379] >
```

Срок действия (Expiration) и время жизни (TTL)

В Redis можно указать, что ключ должен существовать только в течение определенного времени. Это достигается с помощью команд EXPIRE и TTL. Сначала установим новую пару «ключ-значение».

А затем установим срок его действия в 2 минуты (120 секунд) с помощью команды EXPIRE.

Это устанавливает, что ключ resource:lock будет удален через 120 секунд. Можно проверить, как долго ключ будет существовать, с помощью команды TTL. Она возвращает количество секунд до его удаления. Подождав 114 секунд и выполнив ту же команду снова, видим, что он был удален.

Значение -2 для TTL ключа означает, что ключ (больше) не существует. Проверяем с помощью команды EXISTS.

Если вы SET-ите новое значение для ключа, его TTL будет сброшен. Создать значение сразу со сроком действия. Это можно сделать либо с помощью специальной команды SETEX, либо с помощью SET и опции EX. Мы видим, что время жизни было установлено при создании.

Теперь используем команду SET, чтобы обновить значение. Мы видим, что время жизни было сброшено.

```
[redis-1:6379> SET resource:lock "Redis Demo"
OK
[redis-1:6379> EXPIRE resource:lock 120
(integer) 1
[redis-1:6379> TTL resource:lock
(integer) 114
[redis-1:6379> TTL resource:lock
(integer) 60
[redis-1:6379> TTL resource:lock
(integer) 11
[redis-1:6379> TTL resource:lock
(integer) 3
[redis-1:6379> TTL resource:lock
(integer) -2
[redis-1:6379> EXISTS resource:lock
(integer) 0
[redis-1:6379> SET resource:lock "Redis Demo 1" EX 120
OK
[redis-1:6379> TTL resource:lock
(integer) 114
[redis-1:6379> SET resource:lock "Redis Demo 2"
OK
[redis-1:6379> TTL resource:lock
(integer) -1
redis-1:6379> █
```

Структуры данных "Список" (List)

Добавить новый элемент в конец несуществующего списка с именем skills с помощью команды RPUSH.

Мы видим, что теперь список содержит 1 элемент. Давайте добавим еще один навык в список skills.

Теперь посмотрим на значения, которые в данный момент находятся в списке skills. Можем использовать команду GET?

Команда GET относится к группе String и не может быть использована для структур list. В таком случае используют команду LRANGE.

LPUSH добавляет новое значение в начало списка.

LRANGE возвращает подмножество списка. Она принимает индекс первого элемента, который требуется получить, в качестве первого параметра, и

индекс последнего элемента, который требуется получить, в качестве второго параметра. Значение -1 для второго параметра означает получение элементов до конца списка.

LLEN возвращает текущую длину списка.

LPOP удаляет первый элемент из списка и возвращает его.

RPOP удаляет последний элемент из списка и возвращает его.

Примечание: теперь в списке остался только один элемент

```
[redis-1:6379> RPUSH skills "Oracle RDBMS"
(integer) 1
[redis-1:6379> RPUSH skills "Redis"
(integer) 2
[redis-1:6379> GET skills
(error) WRONGTYPE Operation against a key holding the wrong kind of value
[redis-1:6379> LRANGE skills 0 -1
1) "Oracle RDBMS"
2) "Redis"
[redis-1:6379> LPUSH skills "SQL Server"
(integer) 3
[redis-1:6379> LRANGE skills 0 -1
1) "SQL Server"
2) "Oracle RDBMS"

Структуры данных "Множество" (Set)

SADD добавляет заданное значение в множество.

SMEMBERS возвращает список всех элементов этого множества.

SREM удаляет заданное значение из множества.

SISMEMBER проверяет, находится ли заданное значение в множестве.

Cassandra является элементом nosql:products, а MongoDB — нет (поэтому результат 0).

SUNION объединяет два или более множества и возвращает список всех элементов.

Сначала создадим еще одно множество продуктов RDBMS

Теперь создадим объединение двух множеств

SUNIONSTORE объединяет два или более множества и сохраняет результат в новое множество.

SINTER находит пересечение двух или более множеств и возвращает список пересекающихся элементов.

Структуры данных "Упорядоченное множество" (Sorted Set)

ZADD добавляет один или несколько элементов в упорядоченное множество.

ZRANGE возвращает диапазон элементов в упорядоченном множестве по индексу (отсортировано от меньшего к большему, т.е. по возрастанию), опционально также возвращает оценки. Индекс начинается с 0.

ZREVRANGE возвращает диапазон элементов в упорядоченном множестве по индексу (отсортировано от большего к меньшему, т.е. по убыванию), дополнительно также возвращает оценки. Индекс начинается с 0.

```

```

Структуры данных "Хэш" (Hash)

HSET устанавливает значение для поля в хэше, хранящемся по заданному ключу.

Чтобы получить сохраненные данные, используйте команду HGETALL

Вы также можете установить несколько полей одновременно с помощью команды HMSET.

Давайте убедимся, что это сработало и был создан новый хэш.

Если требуется получить значение только одного поля, это также возможно с помощью команды HGET.

Числовые значения в полях хэша обрабатываются точно так же, как и в простых строках, и существуют операции для атомарного увеличения этого значения.

```
[redis-1:6379] > HSET user:1000 name "John Smith"
(integer) 1
[redis-1:6379] > HSET user:1000 email "john.smith@example.com"

Дополнительные возможности Redis

Геопространственные данные

Redis поддерживает работу с географическими координатами через команды GEO

```
[redis-1:6379> GEOADD cities:russia 37.6176 55.7558 "Moscow"
(integer) 0
redis-1:6379> GEOADD cities:russia 30.3351 59.9311 "Saint Petersburg"
(integer) 0
redis-1:6379> GEOADD cities:russia 82.9346 55.0084 "Novosibirsk"
(integer) 0
redis-1:6379> GEORADIUS cities:russia 37.6176 55.7558 500 km WITHDIST
1) 1) "Moscow"
   2) "0.0002"
```

Python

Установка библиотеки

```
(base) sofia@MacBook-Air-2 ~ % conda install redis-py
Channels:
- defaults
- conda-forge
Platform: osx-arm64
Collecting package metadata (repodata.json): done
Solving environment: done

## Package Plan ##

environment location: /opt/anaconda3

added / updated specs:
- redis-py
```

The following packages will be downloaded:

package	build	
async-timeout-5.0.1	py311hca03da5_0	16 KB
ca-certificates-2025.7.15	hca03da5_0	127 KB
certifi-2025.8.3	py311hca03da5_0	161 KB
conda-24.11.3	py311hca03da5_0	1.2 MB
redis-py-5.2.0	py311hca03da5_0	527 KB
	Total:	2.0 MB

The following NEW packages will be INSTALLED:

```
async-timeout      pkgs/main/osx-arm64::async-timeout-5.0.1-py311hca03da5_0
redis-py          pkgs/main/osx-arm64::redis-py-5.2.0-py311hca03da5_0
```

The following packages will be UPDATED:

```
ca-certificates
certifi
conda
```

2024.9.24-hca03da5_0	-->	2025.7.15-hca03da5_0
2024.8.30-py311hca03da5_0	-->	2025.8.3-py311hca03da5_0
24.9.2-py311hca03da5_0	-->	24.11.3-py311hca03da5_0

Proceed ([y]/n)? y

Downloading and Extracting Packages:

```
Preparing transaction: done
Verifying transaction: done
Executing transaction: done
(base) sofia@MacBook-Air-2 ~ %
```

Подключение к Redis из Python и проверка соединения

```
import redis
r = redis.Redis(host='localhost', port=6379, db=0)

!pip install redis
Requirement already satisfied: redis in /opt/anaconda3/lib/python3.11/site-packages (6.4.0)

r.ping()

True

r.set('foo','bar')

True
```

Полный пример для Jupyter:

```
import redis

# Создаем подключение (используем localhost, т.к. Jupyter на хосте VM)
# decode_responses=True автоматически преобразует ответы из байтов в строки
# r = redis.Redis(host='localhost', port=6379, db=0, decode_responses=True)
r = redis.Redis(host='localhost', port=6379, db=0, decode_responses=True)

# 1. Проверяем соединение
try:
    if r.ping():
        print("Соединение с Redis установлено!")
except redis.exceptions.ConnectionError as e:
    print(f"Не удалось подключиться к Redis: {e}")

# 2. Устанавливаем значение
key = 'message:1'
value = 'Hello from Python!'
result = r.set(key, value)
print(f"Команда SET для ключа '{key}' выполнена успешно: {result}")

# 3. Получаем значение обратно
retrieved_value = r.get(key)
print(f"Полученное значение для ключа '{key}': {retrieved_value}")

# 4. Удаляем ключ для очистки
r.delete(key)
print(f"Ключ '{key}' удален.")

Соединение с Redis установлено!
Команда SET для ключа 'message:1' выполнена успешно: True
Полученное значение для ключа 'message:1': Hello from Python!
Ключ 'message:1' удален.
```

ИНДИВИДУАЛЬНОЕ ЗАДАНИЕ

Задание 3 (Redis)

Сохранить в хэш request:xyz данные о ip, user_agent, timestamp. Получить только ip и user_agent с помощью HMGET.

На питоне:

```
import redis
from datetime import datetime

# подключение к Redis
r = redis.Redis(host="localhost", port=6379, db=0)

# сохраняем данные в хэш
r.hset("request:xyz", mapping={
    "ip": "192.168.0.1",
    "user_agent": "Mozilla/5.0",
    "timestamp": datetime.now().isoformat()
})

# получаем только ip и user_agent
ip, user_agent = r.hmget("request:xyz", "ip", "user_agent")

print("IP:", ip.decode())
print("User-Agent:", user_agent.decode())
```

```
IP: 192.168.0.1
User-Agent: Mozilla/5.0
```

Проверим через терминал: сначала выведем все содержимое хэша, а потом только ip и user_agent с помощью HMGET.

```
[redis-1:6379> HGETALL request:xyz
1) "ip"
2) "192.168.0.1"
3) "user_agent"
4) "Mozilla/5.0"
5) "timestamp"
6) "2025-09-09T15:23:39.551179"
[redis-1:6379> HMGET request:xyz ip user_agent
1) "192.168.0.1"
2) "Mozilla/5.0"
redis-1:6379> █
```

Только при помощи терминала:

```
redis-1:6379> DEL request:xyz
(integer) 1
redis-1:6379> HSET request:xyz ip "192.168.1.100" user_agent "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7) AppleWebKit/537.36 Safari/537.36" timestamp "1725891234"
(integer) 3
redis-1:6379> HGETALL request:xyz
1) "timestamp"
2) "1725891234"
3) "user_agent"
4) "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7) AppleWebKit/537.36 Safari/537.36"
5) "ip"
6) "192.168.1.100"
redis-1:6379> HMGET request:xyz ip user_agent
1) "192.168.1.100"
2) "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7) AppleWebKit/537.36 Safari/537.36"
redis-1:6379> █
```

Я удалила старый ключ, заново записала в Redis хэш с ip, user_agent и timestamp, проверила все данные и выбрала отдельно только ip и user_agent.

Работа с Neo4J

Подключение к Cypher Shell

:help, чтобы получить список доступных команд

```

[(base) sofia@MacBook-Air-2 ~ % sudo docker exec -ti neo4j-1 ./bin/cypher-shell -u neo4j -p abc123abc123
[Password:
Connected to Neo4j using Bolt protocol version 5.4 at neo4j://localhost:7687 as user neo4j.
Type :help for a list of available commands or :exit to exit the shell.
Note that Cypher queries must end with a semicolon.
[neo4j@neo4j> :help

Available commands:
:begin      Open a transaction
:commit     Commit the currently open transaction
:connect    Connects to a database
:disconnect Disconnects from database
:exit       Exit the logger
:help        Show this help message
:history    Statement history
:impersonate Impersonate user
:param      Set the value of a query parameter
:rollback   Rollback the currently open transaction
:source     Executes Cypher statements from a file
:sysinfo    Neo4j system information
:use        Set the active database

For help on a specific command type:
:help command

Keyboard shortcuts:
Up and down arrows to access statement history.
Tab for autocompletion of commands, hit twice to select suggestion from list using arrow keys.

For help on cypher please visit:
https://neo4j.com/docs/cypher-manual/current/

neo4j@neo4j> █

```

Подключение через Neo4J Browser

подробно описано в разделе Установка в самом начале

Граф фильмов

Культурные связи между актёрами и фильмами

В верхней панели ввела :play movie graph, чтобы начать работать с учебным пособием Movie Graph (Граф фильмов).

Загрузка графа фильмов

Использовала закрепление (-pin) на панели Movie Graph, чтобы закрепить эту панель сверху.

Нажала на следующий шаг в навигационной панели внизу, чтобы перейти к 2/8.

Нажала на маленькую стрелку слева от команды CREATE .., и она должна появиться в верхней панели.

Выполнила команду CREATE .., чтобы создать граф фильмов и добавить некоторые пробные данные о фильмах.

The screenshot shows the Neo4j browser interface. On the left, there's a sidebar with icons for Graph, Table, Text, and a search bar. The main area has a title bar 'neo4j\$' and a command line '\$_ :play movie graph'. Below this, a section titled 'The Movie Graph' contains a 'Create' button. A large code block is displayed, starting with a multi-line Cypher query to create nodes for cast members and a movie, followed by relationships like 'ACTED_IN' and 'DIRECTED'. A warning message at the bottom says: 'WARNING: This adds data to the current database, each time it is run!'. At the bottom of the browser window, there's a navigation bar with '2 / 8' and several small icons. To the right of the browser window, there's a separate panel titled 'Overview' showing node labels (Person 9, Movie 10) and relationship types (ACTED_IN 10, DIRECTED 10). The central part of the screen displays a graph visualization with nodes for Keanu Reeves, Laurence Fishburne, Carrie-Anne Moss, Hugo Weaving, Lilly Wachowski, Lana Wachowski, and others, connected by directed edges representing their roles in 'The Matrix'.

Прежде чем продолжить со следующим шагом, давайте посмотрим, как выглядит график. Нажала на иконку базы данных в левом верхнем углу браузера Neo4j.

The screenshot shows the Neo4j Database Information page on the left and the Neo4j Browser interface on the right.

Database Information:

- Use database:** neo4j
- Node labels:** Person (348), Movie (10)
- Relationship types:** ACTED_IN (509), FOLLOWED (509), PRODUCED (509), REVIEWED (509), WROTE (509)
- Property keys:** born, name, rating, released, roles, since, summary, tagline, title
- Connected as:** Username: neo4j, Roles: -, Disconnect: :server disconnect
- DBMS:** Cluster role: primary

Neo4j Browser:

- Terminal:** \$:play movie graph
- Create:** A code block containing Cypher queries to create nodes and relationships for the Matrix cast and crew.

```

@CREATE (TheMatrix:Movie {title:'The Matrix', released:1999, tagline:'Welcome to the Real World'})
CREATE (Keanu:Person {name:'Keanu Reeves', born:1964})
CREATE (Carrie:Person {name:'Carrie-Anne Moss', born:1967})
CREATE (Laurence:Person {name:'Laurence Fishburne', born:1961})
CREATE (Hugo:Person {name:'Hugo Weaving', born:1960})
CREATE (LillyW:Person {name:'Lilly Wachowski', born:1967})
CREATE (LanaW:Person {name:'Lana Wachowski', born:1965})
CREATE (Joels:Person {name:'Joel Silver', born:1952})
CREATE (Keanu)-[:ACTED_IN {roles:['Neo']}]→(TheMatrix)
    
```

- Graph View:** Shows a graph with nodes for Keanu Reeves, Carrie-Anne Moss, Laurence Fishburne, Hugo Weaving, Lilly Wachowski, and Lana Wachowski, connected by ACTED_IN relationships.
- Overview:** Node labels: Person (9), Movie (10). Relationship types: ACTED_IN (509), FOLLOWED (509), PRODUCED (509), REVIEWED (509), WROTE (509).

Мы можем увидеть различные Node Labels, Relationship Types и Property Keys, которые были созданы для графа фильмов, а также сколько их создано для каждого типа.

Примеры запросов

Перешла к шагу 3/8, чтобы найти несколько примеров операторов Cypher для поиска информации в графе.

Первый запрос находит актёра по имени "Том Хэнкс".

The screenshot shows the Neo4j Browser interface with three main sections:

- Top Section:** Shows the command `$:play movie graph`. Below it, under "The Movie Graph", there is a "Find" section with examples of Cypher queries:
 - `@MATCH (tom {name: "Tom Hanks"}) RETURN tom`
 - `@MATCH (cloudAtlas {title: "Cloud Atlas"}) RETURN cloudAtlas`
 - `@MATCH (people:Person) RETURN people.name LIMIT 10`
 - `@MATCH (nineties:Movie) WHERE nineties.released > 1990 AND nineties.released < 2000 RETURN nineties.title`
- Middle Section:** Shows the command `neo4j$ MATCH (tom {name: "Tom Hanks"}) RETURN tom`. The results pane displays an "Overview" with "Node labels" (`*` (t) and `Person (t)`) and a note "Displaying 1 nodes, 0 relationships". A single purple circular node labeled "Tom Hanks" is shown.
- Bottom Section:** Shows the same command and results as the middle section, with the purple "Tom Hanks" node visible again. A tooltip at the bottom left says "Use Cmd + scroll to zoom" and "Don't show again".

Теперь найдём фильм с названием "Cloud Atlas"

The screenshot shows the Neo4j browser interface. In the top-left corner, there's a sidebar with various icons: a magnifying glass, a star, a play button, a refresh, a gear, and a user profile. The main area has a title bar 'neo4j\$' and a status bar at the bottom with '3 / 8' and a series of small arrows.

In the center, there's a search bar containing the query: `MATCH (cloudAtlas {title: "Cloud Atlas"}) RETURN cloudAtlas`. Below the search bar, there's a placeholder text: 'Find 10 people...'. Further down, another query is shown: `MATCH (people:Person) RETURN people.name LIMIT 10`, with the placeholder 'Find movies released in the 1990s...'. At the bottom of the central area, there's a footer with the text '3 / 8 < = = = = >'.

On the right side, there's a panel titled 'Overview' which says 'Displaying 1 nodes, 0 relationships.' It shows node labels: `*` (1), `Movie` (1). Below that, it lists relationship types: `*` (10), `ACTED_IN` (4), `DIRECTED` (3), `WRITED` (1), `PRODUCED` (1), and `REVIEWED` (1).

The main visual area shows a single orange circular node labeled 'Cloud Atlas'. To its right, there's a small search icon.

Результат похож на предыдущий, но в этот раз возвращается другой тип узла — Movie (Movie node), и поэтому он показан другим цветом. Вы можете кликнуть по узлу и развернуть связь с/на узел фильма "Cloud Atlas".

Нажмите на кнопку "Развернуть" (expand), и вы увидите все узлы, связанные с узлом фильма.

This screenshot shows the same Neo4j browser interface after expanding the 'Cloud Atlas' node. The central graph view now displays several purple circular nodes representing people, each connected to the central orange 'Cloud Atlas' node by different relationship types.

The nodes include: Tom Tykwer, Jim Broadbent, Halle Berry, Tom Hanks, Lara Wachsmann, Jessica Thomas, Stefan Arndt, and David Mitchell. Relationships shown include: DIRECTED (Tom Tykwer to Cloud Atlas), ACTED_IN (Jim Broadbent, Halle Berry, Tom Hanks to Cloud Atlas), WRITED (David Mitchell to Cloud Atlas), PRODUCED (Stefan Arndt to Cloud Atlas), REVIEWED (Jessica Thomas to Cloud Atlas), and DIRECTED (Lara Wachsmann to Cloud Atlas).

A tooltip at the bottom of the graph area says: 'Use Cmd + scroll to zoom' and 'Don't show again'.

The right-hand 'Overview' panel now shows 'Displaying 1 nodes, 0 relationships.' and lists node labels: `*` (1), `Movie` (1), `Person` (10). Relationship types listed are: `*` (10), `ACTED_IN` (4), `DIRECTED` (3), `WRITED` (1), `PRODUCED` (1), and `REVIEWED` (1).

The bottom-most section of the interface shows another query: `MATCH (tom {name: "Tom Hanks"}) RETURN tom`.

Мы видим, что все они относятся к типу Person (что показывается одинаковым цветом).

Выполнила все запросы на панели 3/8

The screenshot shows the Neo4j browser interface. The top navigation bar has tabs for 'neo4j\$', 'Cypher', 'Graph', and 'Logs'. On the left, there's a sidebar with icons for file operations, a star for bookmarks, and a play button for running queries. The main area has two query panes. The top pane contains the Cypher query: `MATCH (people:Person) RETURN people.name LIMIT 10`. Below it is a note: 'Find movies released in the 1990s...'. The bottom pane shows the results of the previous query as a table:

people.name
"Keanu Reeves"
"Carrie-Anne Moss"
"Laurence Fishburne"
"Hugo Weaving"
"Lilly Wachowski"
"Lana Wachowski"

Below the table, a message says: 'Started streaming 10 records after 52 ms and completed after 59 ms.'

This screenshot shows the Neo4j browser after running the second query. The top navigation bar and sidebar are identical to the previous screenshot. The main area now has two query panes. The top pane contains the Cypher query: `MATCH (nineties:Movie) WHERE nineties.released >= 1990 AND nineties.released < 2000 RETURN nineties.title`. Below it is a note: 'Find movies released in the 1990s...'. The bottom pane shows the results of the second query as a table:

nineties.title
"The Matrix"
"The Devil's Advocate"
"A Few Good Men"
"As Good as It Gets"
"What Dreams May Come"
"Snow Falling on Cedars"

Below the table, a message says: 'Started streaming 20 records after 59 ms and completed after 141 ms.'

At the very bottom of the screen, a third query pane is partially visible: `neo4j$ MATCH (people:Person) RETURN people.name LIMIT 10`.

\$:play movie graph

The Movie Graph

Query

Finding patterns within the graph.

Actors are people who acted in movies
Directors are people who directed a movie
What other relationships exist?
help MATCH

List all Tom Hanks movies...

```
⑥ MATCH (tom:Person {name: "Tom Hanks"})-[:ACTED_IN]→(tomHanksMovies) RETURN tom,tomHanksMovies
```

Who directed "Cloud Atlas"?

```

The Movie Graph

Extend Tom Hanks co-actors, to find co-co-actors who haven't worked with Tom Hanks...

```
④ MATCH (tom:Person {name:"Tom Hanks"})-[:ACTED_IN]→(m)←[:ACTED_IN]-(coActors),
      (coActors)-[:ACTED_IN]→(m2)←[:ACTED_IN]-(cocoActors)
WHERE NOT (tom)-[:ACTED_IN]→()←[:ACTED_IN]-(cocoActors) AND tom ≠ cocoActors
RETURN cocoActors.name AS Recommended, count(*) AS Strength ORDER BY Strength DESC
```

Find someone to introduce Tom Hanks to Tom Cruise

```
④ MATCH (tom:Person {name:"Tom Hanks"})-[:ACTED_IN]→(m)←[:ACTED_IN]-(coActors),
      (coActors)-[:ACTED_IN]→(m2)←[:ACTED_IN]-(cruise:Person {name:"Tom Cruise"})
RETURN tom, m, coActors, m2, cruise
```

Recommend

Let's recommend new co-actors for Tom Hanks. A basic recommendation approach is to find connections past an immediate neighborhood which are themselves well connected.

For Tom Hanks, that means:

- Find actors that Tom Hanks hasn't yet worked with, but his co-actors have.
- Find someone who can introduce Tom to his potential co-actor.

Recommended

	Strength
"Tom Cruise"	5

neo4j\$ neighborhood which are themselves well connected.

For Tom Hanks, that means:

Find actors that Tom Hanks hasn't yet worked with, but his co-actors have.

Find someone who can introduce Tom to his potential co-actor.

```
© MATCH (tom:Person {name:"Tom Hanks"})-[:ACTED_IN]→(m)←[:ACTED_IN]-(coActors),
(coActors)-[:ACTED_IN]→(m2)←[:ACTED_IN]-(cruise:Person {name:"Tom Cruise"})
RETURN tom, m, coActors, m2, cruise
```

ИНДИВИДУАЛЬНОЕ ЗАДАНИЕ

Загрузка данных

Создание компаний

The screenshot shows the Neo4j Browser interface. On the left, the 'Database Information' sidebar is visible, showing the database is 'neo4j' and the node count is 5. It also lists node labels (Company) and relationship types. The main area displays a graph with five nodes: 'GHI Group', 'DEF Ltd', 'JKL Co', 'XYZ Inc', and another unlabeled blue node. A tooltip suggests using 'Cmd + scroll to zoom'. The right panel shows an 'Overview' of the database, indicating 5 nodes and 0 relationships.

```
neo4j$ MATCH (n:Company) RETURN n LIMIT 25
```

Overview
Node labels
Company (5)
Displaying 5 nodes, 0 relationships.

Создание сотрудников

The screenshot shows the Neo4j Browser interface. On the left, the 'Database Information' sidebar is visible, showing the database is 'neo4j' and the node count is 10. It lists node labels (Company, Employee). The main area displays a graph with ten red circular nodes, each labeled with a name: 'David Miller', 'Sarah Johnson', 'Emily Gray', 'Frank Lee', 'Grace Blue', 'John Doe', 'Jane Smith', 'Bob Carter', 'Alice Green', and 'Howard Pink'. A tooltip suggests using 'Cmd + scroll to zoom'. The right panel shows an 'Overview' of the database, indicating 10 nodes and 0 relationships.

```
neo4j$ MATCH (n:Employee) RETURN n LIMIT 25
```

Overview
Node labels
Employee (10)
Displaying 10 nodes, 0 relationships.

Создание проектов

The screenshot shows the Neo4j browser interface. On the left, the 'Database Information' sidebar is visible, showing the database is set to 'neo4j'. It includes sections for 'Node labels' (Company, Employee, Project), 'Relationship types' (none listed), and 'Property keys' (various fields like id, name, position, rating, etc.). The main area displays a graph with ten nodes labeled Project A through Project X. Below the graph, the command line interface (CLI) shows the query: `neo4j$ MATCH (n:Project) RETURN n LIMIT 25`. The CLI output indicates 10 nodes were displayed. A tooltip at the bottom right of the graph area says 'Use Cmd + scroll to zoom'.

Создание клиентов

The screenshot shows the Neo4j browser interface. The 'Database Information' sidebar is identical to the previous one, showing the database is set to 'neo4j'. The main area displays a graph with ten nodes labeled Client A through Client H. Below the graph, the command line interface (CLI) shows the query: `neo4j$ MATCH (n:Client) RETURN n LIMIT 25`. The CLI output indicates 10 nodes were displayed. A tooltip at the bottom right of the graph area says 'Use Cmd + scroll to zoom'.

2	9	"Client I"	9	"Project F"

Started streaming 2 records after 1519 ms and completed after 1664 ms.

Задание 5 Найдите все роли сотрудника "Carol White" в проектах.

```

1 MATCH (e:Employee {name: "Carol White"})-[:PARTICIPATES_IN]→(p:Project)
2 RETURN p.id AS ProjectID, p.name AS ProjectName, r.role AS Role
3 ORDER BY p.id;
4

```

	ProjectID	ProjectName	Role
1	5	"Project B"	"UX Designer"

Started streaming 1 records after 1727 ms and completed after 1765 ms.

Выводы

В ходе выполнения лабораторной работы были изучены основные концепции и операции для трех типов NoSQL баз данных:

- MongoDB — создание коллекций и документов, выполнение запросов с фильтрацией, обновление и удаление данных, использование индексов для оптимизации.
- Redis — работа с хэшами, добавление и выборка данных по ключам, применение команд для управления значениями.
- Neo4j — работа с графовой моделью, создание узлов и связей, выполнение запросов на языке Cypher.

В результате были получены практические навыки по созданию, наполнению и запросу данных в различных NoSQL системах, а также понимание различий между моделями данных и областями их применения.
